# Run

# Map

- Get user's location every second
- Keep camera follow user in a fixed direction and in a good zoom level.
- Every second, draw a line on map between location in this second and location in last second
- Every second, store location in a List for drawing a colorful route in report page.
- Every second, update real-time information such as duration, pace, and etc.

# Roadblock

## Route Heatmap Logic

LocationList = {(lat,lon),(lat,lon),(lat,lon),.....,(lat,lon)} *Every second, we get one more (lat,lon) in the LocationList.*

speed = {Distance between two (lat,long)} / 1 (meter/sec) -----> speedList[]

Weight (percentage) = (current speed- min speed)/(max speed - min speed)

Color of speed = ColorList[weight \* ColorList.length]

Min speed

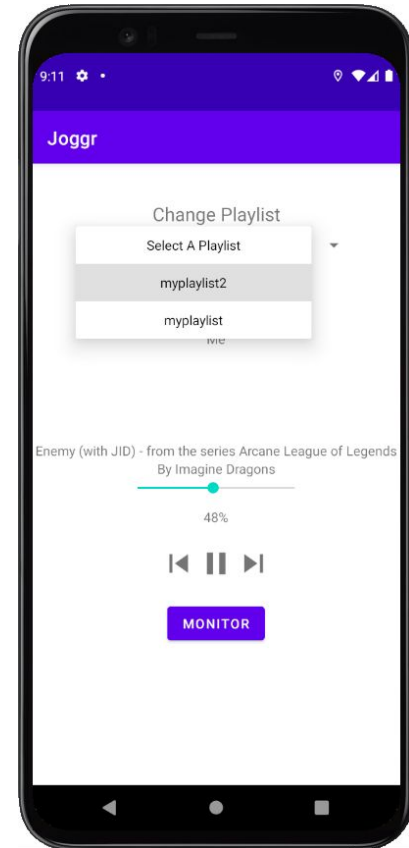

Max speed

ColorList = { (255,0,0), (255,1,0),.....,(255,255,0),(254,255,0),..... (0,255,0)}

# Spotify

- **Spotify App Remote Library**
  - Connect to Spotify player
- **Spotify Authentication Library**
  - Get Access token
- **Spotify Web Api**
  - Get User's data

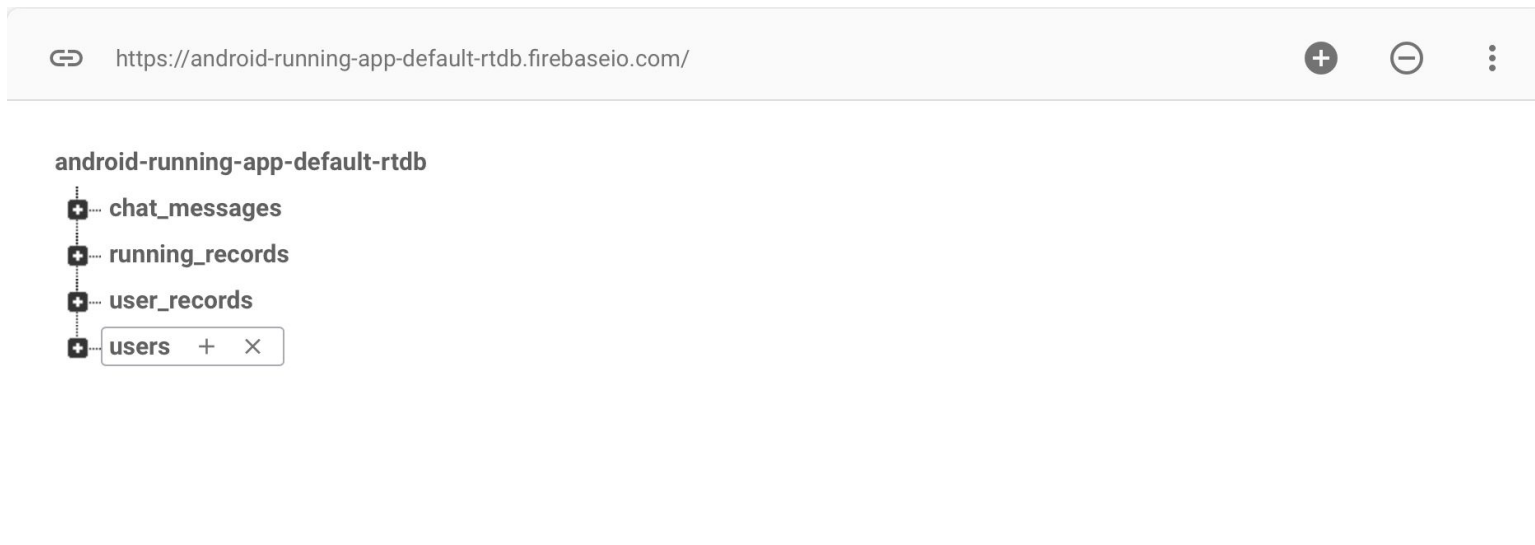

# Firestore Library

- Firestore Auth
- Firestore User
- Firestore Database
- Firestore Storage

# Firebase Database Structure

# Firebase Storage Structure

<input type="checkbox"/>	 user_route_images/	—	文件夹	—

# Struggles

- Premium account is required to play/stop/select playlists
- Spotify API has an user and access limit - with more users, need to apply for extension

From the spotify website:

## **Building your app with rate limits in mind**

Every app is different and you'll want to plan your app architecture and user experience with rate limits in mind. Here are a few techniques that can help you design an app that works well with Spotify's Web API rate limits:

### **Apply for extended quota mode**

If your app is meant to be used by many Spotify users at the same time then you should apply for [extended quota mode](#). Apps in this mode have a rate limit that is much higher than apps in development mode, the default mode for new apps. You can apply for a quota extension by opening your app detail page in the [Developer Dashboard](#) and tapping on the Request Extension link.

# Future Work

- Better sorting filter in different ways (trends, like)
- Animation of route playback
- Professional statistic analysis
  - Distance ran for a marathon
  - Goal system
- Refined tracking features
  - Increase location accuracy
- Enhance social features
- Styling
- Commercial :
  - Work with sport brand to advertising their product
  - Let user register their sneaker type so that system can rate what is the popular sneaker for which type of running goal
  - Let user who achieve certain mileage to get discount on premium spotify membership in the next month
